

A Right Hand Circularly Polarized Helical Antenna For High Altitude Balloon UHF Beacon Reception

The Axial Radiating Helical Antenna was

To his surprise the wire radiated a strong

The bandwidth is also quite generous, covering

Arlington Blvd., ANN ARBOR, MICHIGAN, U. S. A.

Radio Engineers

Many thanks for your report on the reception of
my 75 meter fone signals on Feb. 10, 1933.

Vy 73, JOHN D. KRAUS

W8JK also invented the Close Spaced Two Driven Element Beam that
He published "Antennas" 1st Ed. In 1950 and 2nd Ed. In 1988.

Helix antenna design and construction details

Input data (design requirements)

Design frequency	<input type="text" value="435"/>	MHz
Number of turns	<input type="text" value="8.5"/>	
Turn spacing	<input type="text" value="0.23"/>	wavelengths
<input type="button" value="Calculate"/>		

The results

Legend. The letters in the image are used in the table below.
To get a large version, click on the image.

Wavelength		<input type="text" value="689.6"/>	mm
Ideal diameter (internal)	D=	<input type="text" value="236.3"/>	mm
Gain		<input type="text" value="12.47"/>	dBi

A quick Google search will find

Entering 435MHz and 8.5 Tu

Back in the mid 80's I built a 2 meter 10 turn Helical on the flat roof of my
It was Huge! And had great Gain for the Phase 3 Amsat Satellites, when

Wavelength		689.6	mm
Ideal diameter (internal)	D=	236.3	mm
Gain		12.47	dBi
Conductor diameter	d=	13.7	mm
Winding step (between centers)	S=	158.6	mm
Separation of the adapter section	a=	6.6	mm
Total conductor length		6452.9	mm
Minimum reflector diameter	R=	427.5	mm
Total antenna length	L=	1348.2	mm

Design performance

Bandwidth (@ -1dB)	Fmax/Fmin:	1.06	
	Fmax:	448.86	MHz
	Fmin:	421.56	MHz
Bandwidth (@ -3dB)	Fmax/Fmin:	1.16	
	Fmax:	468.89	MHz
	Fmin:	403.55	MHz
Beam width (@ -3dB)		37.1	degrees

Mission Requirement: Receive Beacon Transmission from Balloon

Balloon will carry an APRS Beacon, to enable Payload Recovery

Beacon Transmitter Power: 10mW, or +10dBm on 435 MHz

Path Loss from 100 000 ft = ~ -130 dB

Balloon Antenna Gain = +6dBi Horizontally Polarized

Helical Receive Antenna Gain = 12 dBi

Path Margin = ~ -102 dB

Receive MDS = -123dB

Signal Loss due to Polarization Mismatch unacceptable.

Therefore a Circularly Polarized Gain Receive Antenna is a Must!
